Neutron Stars at the Crossroads of Fundamental Physics

Vancouver, Canada, 9-13 August 2005

Thermal, radio-quiet isolated neutron stars

- Soft X-ray sources in ROSAT survey
- Blackbody-like X-ray spectra, NO non-thermal hard emission
- Low absorption $\sim 10^{20}$ H cm $^{-2}$, nearby, parallax for RX J1856.5-3754: 117 pc
- Luminosity $\sim 10^{31}$ erg s $^{-1}$ (dim)
- Constant X-ray flux on time scales of years (RX J0720.4–3125 ?)
- No obvious association with SNR
- No radio emission
- Optically faint
- Some (all?) are X-ray pulsars (3.45 – 11.37 s)

best candidates for „genuine“ INSSs with undisturbed emission from stellar surface
