

Today's Plan:

- Announcements
- Using Analog to Digital Converter – continuation
- Using Pulse Width Modulation
- Activity 3
- Ultrasonic Distance Sensor

In weeks 3-4 you have to finish parts 4, 5, 6 and 7 of the manual

Notes will be due before each lab during the week 5 of the labs.

Pulse Width Modulation (PWM)

Full range square wave like this one

Pulse Width Modulation (PWM)

Controlling power with PWM

Duty cycle of PWM

Ratio of pulse width to period usually expressed in %. Sometimes the pulse width is referred as duty cycle.

Pulse Width Modulation (PWM)

Applications:

Power control without energy loss. (Compare with voltage divider).

Controlling the servos.

3	CCI	R	0h	Capture/compare input. The selected input signal can be read by this bit.
2	OUT	RW	0h	Output. For output mode 0, this bit directly controls the state of the output. 0b = Output low 1b = Output high

12.2.5.2 Output Example — Timer in Up Mode

The OUT_x signal is changed when the timer *counts* up to the $TAOCCR_x$ value, and rolls from $TAOCCR_0$ to zero, depending on the output mode. An example is shown in Figure 12-12 using $TAOCCR_0$ and $TAOCCR_1$

Figure 12-12. Output Example—Timer in Up Mode

Ultrasonic distance sensor

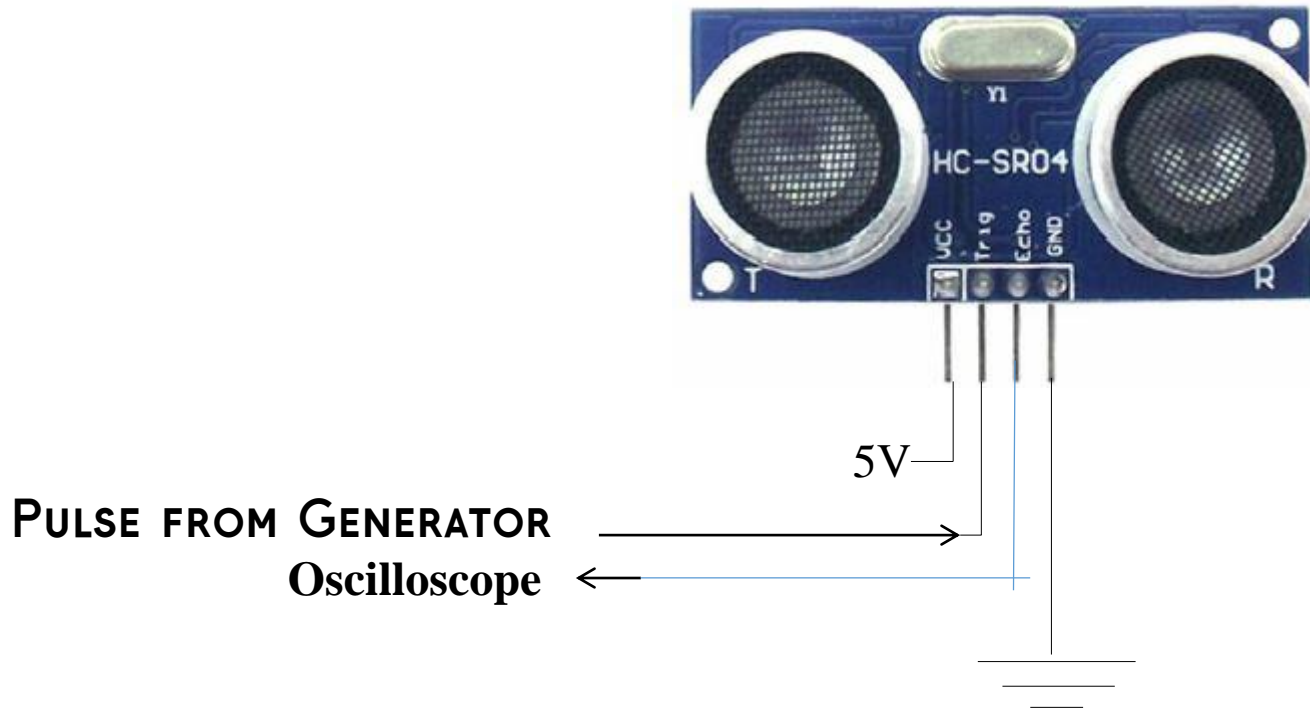

Idea comes from bats and dolphins

- Send a pulse (chirp) of high frequency sound
- Wait for the echo
- Estimate or calculate distance from a time between the send time and return time

Radars work on the same principle but with electromagnetic waves.

LADAR (LIDAR)

Connecting the ultrasonic distance sensor to test it:

Pulse amplitude should be 2V, offset 0 (no negative part), short with frequency allowing echo to return from a long distance (say 15 m) before the next pulse comes in.

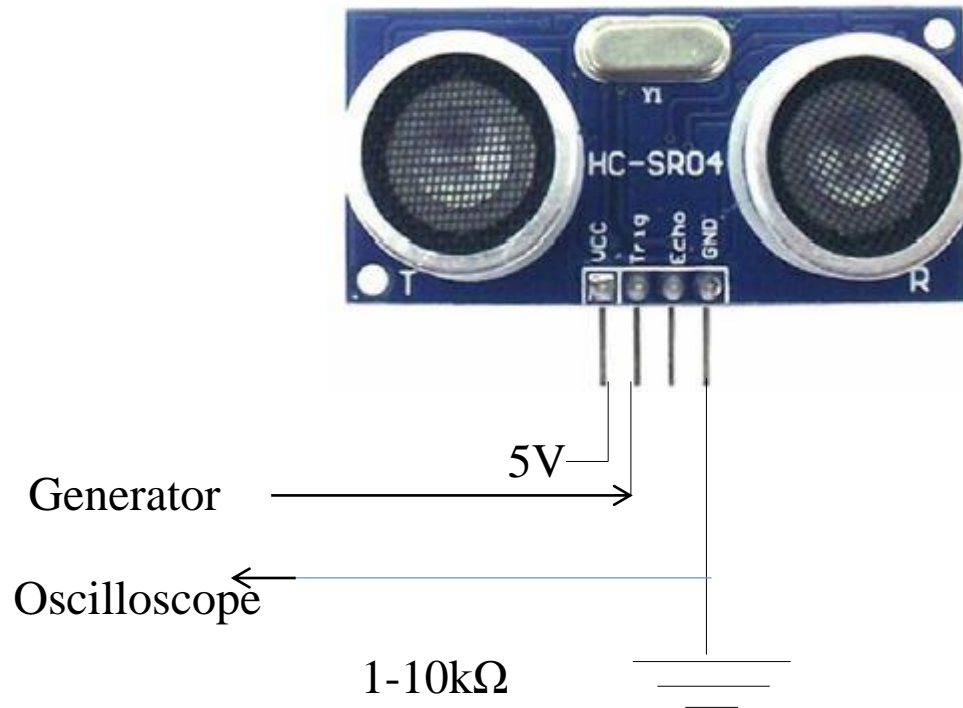

You should see the width of the echo pulse on the oscilloscope changing when you move an object (for example box) farther or closer to the sensor.

Distance measurement with real-time display on the computer. Program should:

1. Trigger the ultrasonic distance measurement sensor to begin a measurement.
2. Do nothing till the “echo” pin goes high
3. Time the interval while the echo pin is high
4. Transmit the time interval through the serial port to the host computer where a python program will receive it and print or plot it.

Connecting the ultrasonic distance sensor to Hantek for testing:

The SR04 is a 5V device! To protect the MSP430 input from it, you should put a resistor in between the 'Echo' line and the MSP430. 3.3 V pulse is high enough to trigger it.

Python and GUI's

For part 8 you will need Python installed and example temperature programs tested.

Python is a “high-level language” (complicated things are often easier)

It is interpreted, not compiled which make it faster to change program but the execution is slower and it take more memory.

It has the same format on windows, mac and linux

Remember that in python white spaces and indenting matters (unlike C where it's just for readability)

Activity 3 due before each lab in week 5 of the labs. 2 points

The result of ADC conversion on MSP430 is a 12 bit binary number corresponding to voltage range 0-3.3 V.

1. What is the accuracy (resolution) of the conversion in volts?
2. What command or commands will you use to convert this 12 bit number to 8 bit number without loosing the 0-3.3 V range.
3. How such a conversion affects the accuracy (resolution) in volts.
